

MARION PRESSURE TREATING COMPANY UNION PARISH LOUISIANA

EPA REGION 6
CONGRESSIONAL DISTRICT 05

Contact:
Bart Cañellas 214-665-6662

Updated: September 2006

EPA ID# LAD008473142
Site ID: 0604491

Current Status

- Approximately \$5 million has been spent to complete the removal work, remedial investigation, and the remedial design.
- EPA has determined that this site does not pose an immediate threat to human health, and will continue to monitor this site for any changes that may trigger additional action. EPA will consider funding new work at this site in Fiscal Year 2007.
- EPA is also reviewing the selected remedy with the U.S. Army Corps of Engineers to explore if other remediation options are feasible.

Benefits

- Remediation of the contaminated media will reduce the health and ecological risk associated with the contaminants.
- The EPA is working with the city and the community to ensure the property will meet future planned land use.

National Priorities Listing (NPL) History

Proposal Date: October 22, 1999
Final Date: February 4, 2000

Location: The former facility is situated on a 10-acre tract of land along State Highway 551, approximately 0.5 miles north of the junction of State Highways 551 and 33 in the town of Marion, Union Parish, Louisiana. Facility operations extended beyond the 10-acres and current areas of concern cover over 22-acres.

Setting: The facility, located in a rural area, is an inactive and abandoned wood treating plant that was in operation from 1964 to 1989. The facility treated wood products, including poles, bridge pilings, fence posts, and other lumber, using a creosote pressure impregnation process.

Population: Marion, one of the oldest towns in Union Parish, was settled by pioneers from Alabama, who named it after their old home county in that state. It was first incorporated on

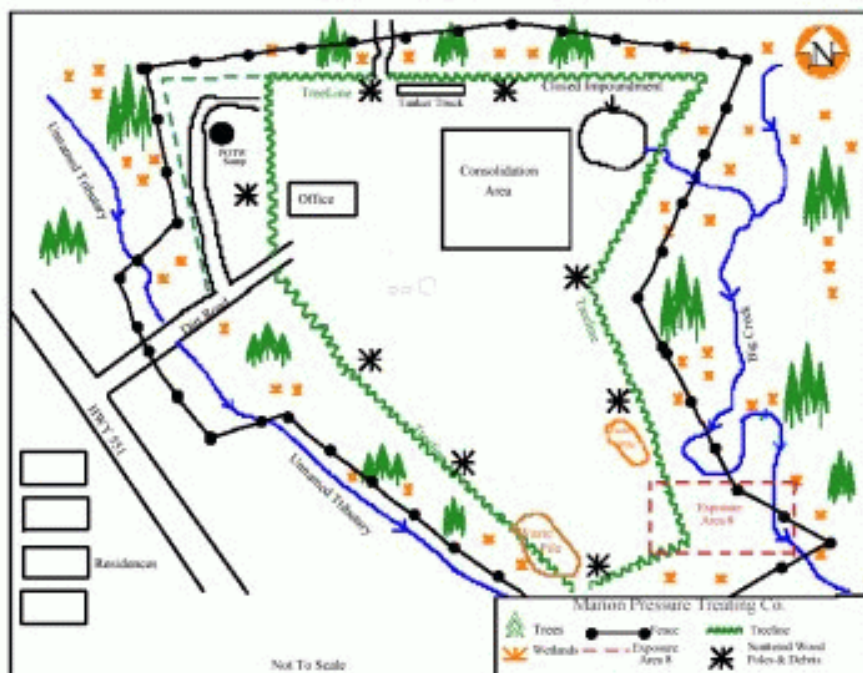

The facility is bounded by forestland. Big Creek, a small surface water body, lies approximately 500 feet east-southeast of the facility. Big Creek empties into Bayou de Loutre approximately 7.5 miles south of the facility.

Bayou de Loutre is classified as a natural and scenic stream and is used for the recreational fishing of catfish, panfish, white perch, and bass. A State wildlife management area is located 4 miles north of Marion. The Upper Ouachita Wildlife Refuge is located approximately 5 miles east, and federally listed endangered species such as the red-cockaded woodpecker and the bald eagle are known to live there.

There are three source areas of possible concern:

On-site Area: Soils may contain low levels of volatile and semivolatile organic compounds, specifically polynuclear aromatic hydrocarbons (PAHs), in the former process area, tank product storage area, monitoring wells, and drainage pathways on the side of the former processing area. Several clusters of small creosote piles have also been identified in the woods, south of the facility, adjacent to and upgradient of the wetlands and Big Creek

Site Map

Health Considerations

The potential for elevated health/ecological risk levels is due to various organic compounds associated with creosote and the wood treatment process.

These creosote related compounds, in on-site soil and the stream sediments are the leading concern at this site because of the ecological value of the creek.

Record of Decision (ROD)

The ROD was signed on June 28, 2002.
